## Greedy-algorithm:

- start with $f(e)=0$ everywhere
- find an $s$-t path with $f(e)<c(e)$ on every edge
- augment flow along the path
- repeat as long as possible

## Augmenting Path Algorithm

## Definition 1

An augmenting path with respect to flow $f$, is a path from $s$ to $t$ in the auxiliary graph $G_{f}$ that contains only edges with non-zero capacity.

```
Algorithm 1 FordFulkerson(G=(V,E,c))
    Initialize }f(e)\leftarrow0\mathrm{ for all edges.
    while \exists}\mathrm{ augmenting path p in G}\mp@subsup{G}{f}{}\mathrm{ do
        augment as much flow along pas possible.
```

## The Residual Graph

From the graph $G=(V, E, c)$ and the current flow $f$ we construct an auxiliary graph $G_{f}=\left(V, E_{f}, c_{f}\right)$ (the residual graph):

- Suppose the original graph has edges $e_{1}=(u, v)$, and $e_{2}=(v, u)$ between $u$ and $v$.
- $G_{f}$ has edge $e_{1}^{\prime}$ with capacity $\max \left\{0, c\left(e_{1}\right)-f\left(e_{1}\right)+f\left(e_{2}\right)\right\}$ and $e_{2}^{\prime}$ with with capacity $\max \left\{0, c\left(e_{2}\right)-f\left(e_{2}\right)+f\left(e_{1}\right)\right\}$.

G

$G_{f} \quad(\mathrm{~L} \rightleftharpoons 12=24 \longrightarrow(0$

## Augmenting Path Algorithm

## Animation for augmenting path , algorithms is only available in the lecture version of the slides

## Augmenting Path Algorithm

Theorem 2
A flow $f$ is a maximum flow iff there are no augmenting paths.

## Theorem 3

The value of a maximum flow is equal to the value of a minimum cut.

Proof.
Let $f$ be a flow. The following are equivalent:

1. There exists a cut $A$ such that $\operatorname{val}(f)=\operatorname{cap}(A, V \backslash A)$.
2. Flow $f$ is a maximum flow.
3. There is no augmenting path w.r.t. $f$.

## Augmenting Path Algorithm

$$
\begin{aligned}
\operatorname{val}(f) & =\sum_{e \in \operatorname{out}(A)} f(e)-\sum_{e \in \operatorname{into}(A)} f(e) \\
& =\sum_{e \in \operatorname{out}(A)} c(e) \\
& =\operatorname{cap}(A, V \backslash A)
\end{aligned}
$$

This finishes the proof.
Here the first equality uses the flow value lemma, and the second exploits the fact that the flow along incoming edges must be 0 as the residual graph does not have edges leaving $A$.

## Augmenting Path Algorithm

1. $\Rightarrow 2$.

This we already showed.
2. $\Rightarrow 3$.

If there were an augmenting path, we could improve the flow.
Contradiction.
3. $\Rightarrow 1$.

- Let $f$ be a flow with no augmenting paths.
- Let $A$ be the set of vertices reachable from $s$ in the residual graph along non-zero capacity edges.
- Since there is no augmenting path we have $s \in A$ and $t \notin A$.

## Analysis

## Assumption:

All capacities are integers between 1 and $C$.
Invariant:
Every flow value $f(e)$ and every residual capacity $c_{f}(e)$ remains integral troughout the algorithm.

## Lemma 4

The algorithm terminates in at most $\operatorname{val}\left(f^{*}\right) \leq n C$ iterations, where $f^{*}$ denotes the maximum flow. Each iteration can be implemented in time $\mathcal{O}(m)$. This gives a total running time of $\mathcal{O}(\mathrm{nmC})$.

Theorem 5
If all capacities are integers, then there exists a maximum flow for which every flow value $f(e)$ is integral

## A Bad Input

Problem: The running time may not be polynomial.

## Question:

Can we tweak the algorithm so that the running time is polynomial in the input length?

$$
\begin{aligned}
& \text { See the lecture-version of the slides for } \\
& \text { the animation. }
\end{aligned}
$$

## A Bad Input

Problem: The running time may not be polynomial.

Question:
Can we tweak the algorithm so that the running time is polynomial in the input length?
11.1 The Generic Augmenting Path Algorithm

## A Pathological Input

Let $r=\frac{1}{2}(\sqrt{5}-1)$. Then $r^{n+2}=r^{n}-r^{n+1}$.

Running time may be infinite!!!

See the lecture-version of the slides for the animation.

## How to choose augmenting paths?

- We need to find paths efficiently.
- We want to guarantee a small number of iterations.

## Several possibilities:

- Choose path with maximum bottleneck capacity.
- Choose path with sufficiently large bottleneck capacity.
- Choose the shortest augmenting path.
